HOW A WEBSITE PROJECT BEGINS

Understand the business. Then design the site.

A website should help a visitor understand the offer, choose a product, and know what to do next. That is why the work begins with the business and the buying context.

> **In the watch website example:** the visual direction draws attention, while the research defines which questions each part of the site needs to answer.

This is a concept project. The document describes the structure of the work without client data or claims about sales results.

PHASE ONE · MARKETING AND PLANNING

What we examine before building

The work begins with a written brief and the business information the client can share. These six areas help turn that input into a clear site plan.

01
The business
We establish what the company offers, whom it serves, and what the website needs to achieve.

02
The customer
We look at how people choose and what they need to know before they enquire or buy.

03
The market
We review how comparable offers are presented and what visitors are likely to expect.

04
The offer
We identify the main message and the evidence the business can use to support it.

05
The site structure
We plan the pages and the order of information so the visitor's path is clear.

06
Measuring the result
We agree which real visitor actions would show whether the site is doing its job.

The outcome: an agreed basis for the copy, visual direction, and development. For a watch website, the catalogue, product pages, and buying information should work together as one clear path.

Project decisions depend on the company's own information. This public example shows the structure without internal materials or a detailed method.

PHASE TWO · DESIGN AND IMPLEMENTATION

Turning the plan into a website

After the research and scope are agreed, the design and development work can begin. The client reviews the important decisions along the way.

01
Scope and content

We confirm the pages, required features, brand materials, product facts, and who provides each piece of content.

02
Visual direction

I prepare layouts that support the agreed message and make important choices easy to find.

03
Client review

The client sees the proposed pages, gives feedback, and approves the direction before the build moves ahead.

04
Development

I build the responsive site and add the agreed content management and integrations where the project needs them.

05
Checks

We review the content, links, forms, main visitor paths, and how the site works on desktop and mobile.

06
Launch and handover

After approval, the site is published and the client receives the relevant access and update guidance.

What the client receives: an agreed plan, reviewable designs, a working site, and a clear handover. The exact features and timing depend on the scope.

This public overview explains a typical process. ELVERAN is a portfolio concept, not a commissioned client case.
